Orig Pub: Glasnik biol. sek. Hrvatsko prirodosl. drustvo, 1953
(1955). Ser. 23, 7, 326-328.

Abstract: In the fruit tree nurseries of Uzh, Pozhezi, Krag-uevtse, Mladenovtse, Zhebarim and Chachke (Yugoslavia), a method is utilized of raising young fruit transplants without shields. This significantly increased the quality and reduced the costs of planting material. The experiments were conducted on a great number of stocks and varieties of fruit trees.

Title : Soil Treatment and Utilization at the Planting
of the Plum Tree, Especially the Soil
Damaged by Erosion

Orig Pub : Pol'oprivreda, 1957, 5, No 1, 26-31

Abstract : In Yugoslavia, the soil, on the whole, is
suitable for the growing of plums, but
their yield is low and periodic. To a
considerable extent, this is caused by the
fact that the soil under the plum trees is
not attended to. A higher level of agricul-
tural engineering is recommended. In the

TITLE: Preparation and properties of fibers from acrylonitrile-diketene copolymer¹

SOURCE: Khimicheskiye volokna, no. 6, 1965, 13-16

TOPIC TAGS: synthetic fiber, acrylonitrile, copolymerization, chemical reaction, tensile strength, rupture strength, elongation

ABSTRACT: Fibers were formed by the wet method from solutions of acrylonitrile-diketene copolymers in dimethylformamide. Copolymers of 40,000-45,000 molecular weight and containing 4-6 mol % diketene on the weight of the copolymer gave most stable solutions from which fibers having 7-8% elongation were formed. Different types of reactive groups were introduced by treating the fibers with hydroxylamine or hexamethylenediamine (HMDA). Introduction of amine or hydroxylamine groups enabled the fibers to be dyed with acid dyes. Chemically dyed fibers were obtained by reacting the copolymer fibers with HMDA and dyes containing amino groups. Subsequent treatment of acrylonitrile-diketene copolymer fibers with HMDA significantly increased the zero-
